

# Sessió 1

En aquesta primera sessió ens familiaritzarem amb l'entorn de treball i alguns conjunts de dades. Començarem amb el conjunt "iris" i, a continuació, podràs prosseguir amb els conjunts "digits" i "olivetti". Finalment, s'introduirà la plataforma "openml" que conté els conjunts de dades que s'usaran en l'exercici de l'examen.

# El corpus iris

El corpus iris ha estat àmpliament utilitzat per a introduir conceptes i mètodes bàsics d'aprenentatge automàtic. Consta de  $N = 150$  mostres, 50 per cadascuna de  $C = 3$  classes, representades mitjançant vectors de  $D = 4$  característiques reals homogènies. Una de las classes és linealment separable de la resta, però les altres dues no són linealment separables. Encara que hui en dia es considera un corpus de "jogueta", segueix sent molt útil per a introduir conceptes i mètodes bàsics.

Primer importem algunes llibreries estàndard i sklearn:

```
In [ ]: import pandas as pd
import seaborn as sns
from sklearn.datasets import load_iris
```

Lectura del corpus iris:

```
In [2]: iris = load_iris()
print(dir(iris))
X = iris.data
y = iris.target
fn = iris.feature_names
cn = iris.target_names
print(iris.DESCR)
```

```
['DESCR', 'data', 'data_module', 'feature_names', 'filename', 'frame', 'target', 'target_names']
.. _iris_dataset:
```

Iris plants dataset

-----

**\*\*Data Set Characteristics:\*\***

:Number of Instances: 150 (50 in each of three classes)  
:Number of Attributes: 4 numeric, predictive attributes and the class

:Attribute Information:

- sepal length in cm
- sepal width in cm
- petal length in cm
- petal width in cm
- class:
  - Iris-Setosa
  - Iris-Versicolour
  - Iris-Virginica

:Summary Statistics:

	Min	Max	Mean	SD	Class Correlation
sepal length:	4.3	7.9	5.84	0.83	0.7826
sepal width:	2.0	4.4	3.05	0.43	-0.4194
petal length:	1.0	6.9	3.76	1.76	0.9490 (high!)
petal width:	0.1	2.5	1.20	0.76	0.9565 (high!)

:Missing Attribute Values: None

:Class Distribution: 33.3% for each of 3 classes.

:Creator: R.A. Fisher

:Donor: Michael Marshall (MARSHALL%PLU@io.arc.nasa.gov)

:Date: July, 1988

The famous Iris database, first used by Sir R.A. Fisher. The dataset is taken from Fisher's paper. Note that it's the same as in R, but not as in the UCI Machine Learning Repository, which has two wrong data points.

This is perhaps the best known database to be found in the pattern recognition literature. Fisher's paper is a classic in the field and is referenced frequently to this day. (See Duda & Hart, for example.) The data set contains 3 classes of 50 instances each, where each class refers to a

type of iris plant. One class is linearly separable from the other 2; the latter are NOT linearly separable from each other.

|details-end|

Convertim el corpus en un dataframe pandas per a facilitar la seua descripció:

```
In [3]: data = pd.DataFrame(data=X, columns=fn)
data['species'] = pd.Series(iris.target_names[y], dtype='category')
data
```

```
Out[3]:
```

	sepal length (cm)	sepal width (cm)	petal length (cm)	petal width (cm)	species
0	5.1	3.5	1.4	0.2	setosa
1	4.9	3.0	1.4	0.2	setosa
2	4.7	3.2	1.3	0.2	setosa
3	4.6	3.1	1.5	0.2	setosa
4	5.0	3.6	1.4	0.2	setosa
...	...	...	...	...	...
145	6.7	3.0	5.2	2.3	virginica
146	6.3	2.5	5.0	1.9	virginica
147	6.5	3.0	5.2	2.0	virginica
148	6.2	3.4	5.4	2.3	virginica
149	5.9	3.0	5.1	1.8	virginica

150 rows × 5 columns

Vejam algumas estatísticas básicas:

```
In [4]: data.describe()
```

```
Out[4]:
```

	sepal length (cm)	sepal width (cm)	petal length (cm)	petal width (cm)
count	150.000000	150.000000	150.000000	150.000000
mean	5.843333	3.057333	3.758000	1.199333
std	0.828066	0.435866	1.765298	0.762238
min	4.300000	2.000000	1.000000	0.100000
25%	5.100000	2.800000	1.600000	0.300000
50%	5.800000	3.000000	4.350000	1.300000
75%	6.400000	3.300000	5.100000	1.800000
max	7.900000	4.400000	6.900000	2.500000

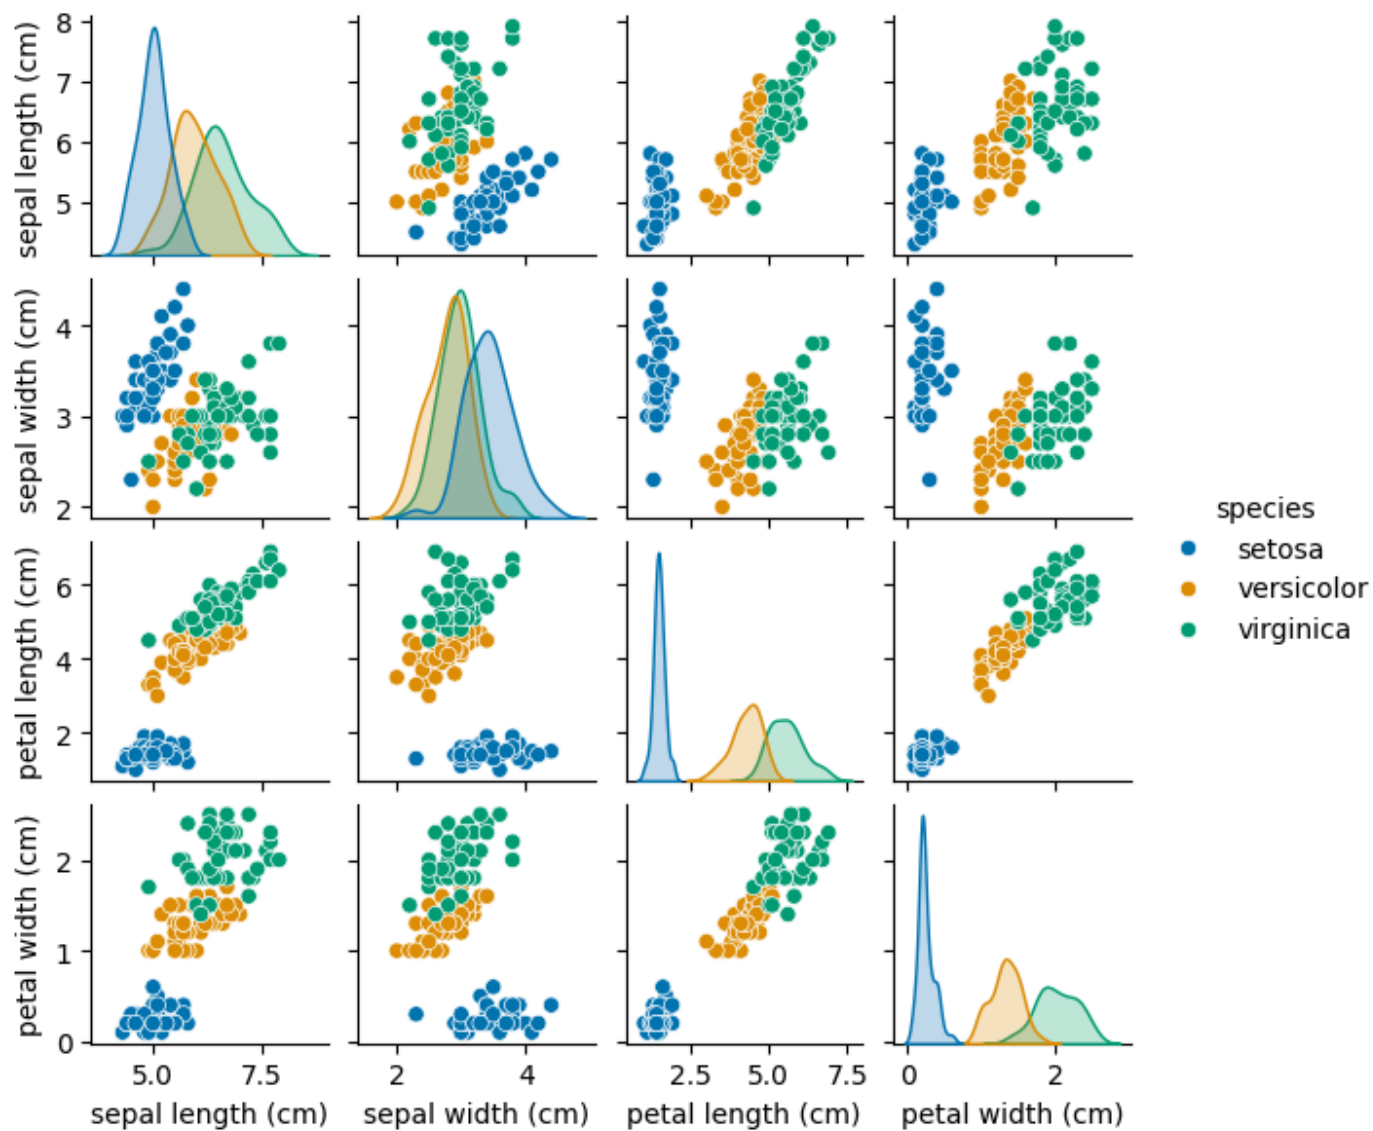

Comprovem que tenim 50 mostres de cada classe:

```
In [5]: data.groupby('species', observed=True).size()
```

```
Out[5]: species
setosa      50
versicolor 50
virginica   50
dtype: int64
```

Com que tenim poques característiques, és bona idea fer un gràfic matricial de dispersió:

```
In [6]: sns.pairplot(data, hue="species", height = 1.5, palette = 'colorblind');
```

**Qüestió:** quina classe se separa linealment de les altres dues?

# El corpus digits

Al igual que iris, digits pot considerar-se un corpus de "joguets". Ara bé, en comparació amb iris, digits suposa un bot de complexitat pel major nombre de classes,  $C = 10$ , mostres,  $N = 1797$ , i dimensió dels vectors de característiques,  $D = 64$ . A més, digits aborda una de las principals tasques perceptives de l'aprenentatge automàtic: el reconeixement de caràcters òptic (OCR) i, més concretament, el reconeixement de dígitos manuscrits. Encara que el reconeixement de dígitos manuscrits es considera una tasca "resolta" des dels anys 90, la classificació d'imatges en general segueix sent una tasca complexa, de gran interès acadèmic i comercial. Així doncs, la relativa senzillesa de digits resulta molt convenient com a tasca introductòria a la classificació d'imatges.

```
In [ ]: import matplotlib.pyplot as plt
        from sklearn.datasets import load_digits
```

```
In [2]: digits = load_digits()
        print(digits.DESCR)
```

```
.. _digits_dataset:
```

```
Optical recognition of handwritten digits dataset
```

```
-----
```

```
**Data Set Characteristics:**
```

```
:Number of Instances: 1797  
:Number of Attributes: 64  
:Attribute Information: 8x8 image of integer pixels in the range 0..16.  
:Missing Attribute Values: None  
:Creator: E. Alpaydin (alpaydin '@' boun.edu.tr)  
:Date: July; 1998
```

This is a copy of the test set of the UCI ML hand-written digits datasets  
<https://archive.ics.uci.edu/ml/datasets/Optical+Recognition+of+Handwritten+Digits>

The data set contains images of hand-written digits: 10 classes where  
each class refers to a digit.

Preprocessing programs made available by NIST were used to extract  
normalized bitmaps of handwritten digits from a preprinted form. From a  
total of 43 people, 30 contributed to the training set and different 13  
to the test set. 32x32 bitmaps are divided into nonoverlapping blocks of  
4x4 and the number of on pixels are counted in each block. This generates  
an input matrix of 8x8 where each element is an integer in the range  
0..16. This reduces dimensionality and gives invariance to small  
distortions.

For info on NIST preprocessing routines, see M. D. Garris, J. L. Blue, G.  
T. Candela, D. L. Dimmick, J. Geist, P. J. Grother, S. A. Janet, and C.  
L. Wilson, NIST Form-Based Handprint Recognition System, NISTIR 5469,  
1994.

Vejam les primeres 10 imatges:

```
In [3]: _, axes = plt.subplots(nrows=1, ncols=10, figsize=(16, 16))
        for ax, image, label in zip(axes, digits.images, digits.target):
            ax.set_axis_off()
            ax.imshow(image, cmap=plt.cm.gray_r, interpolation="none")
            ax.set_title("Mostra {!s}".format(label))
```

# El corpus Olivetti

Olivetti conté  $N = 400$  imatges de cares de  $C = 40$  persones, amb 10 imatges per persona. Les imatges es van adquirir en moments diferents, variant la il·luminació, expressió facial (tancant o no els ulls; somrient o no) i detalls facials (amb o sense ulleres). Totes elles es troben normalitzades a  $64 \times 64$  píxels en escala de gris entre 0 i 1; açò és, cada imatge es pot vore com un vector de  $D = 4096$  dimensions de característiques reals en  $[0, 1]$ . Les persones s'identifiquen amb una etiqueta sencera de 0 a 39.

```
In [ ]: import numpy as np
import matplotlib.pyplot as plt
from sklearn.datasets import fetch_olivetti_faces
```

```
In [2]: orl = fetch_olivetti_faces()
print(orl.DESCR)
```

downloading Olivetti faces from <https://ndownloader.figshare.com/files/5976027> to /home/josanna/scikit\_learn\_data  
.. \_olivetti\_faces\_dataset:

The Olivetti faces dataset

-----

`This dataset contains a set of face images`\_ taken between April 1992 and April 1994 at AT&T Laboratories Cambridge. The  
:func:`sklearn.datasets.fetch\_olivetti\_faces` function is the data  
fetching / caching function that downloads the data  
archive from AT&T.

.. \_This dataset contains a set of face images: <https://cam-orl.co.uk/facedatabase.html>

As described on the original website:

There are ten different images of each of 40 distinct subjects. For some subjects, the images were taken at different times, varying the lighting, facial expressions (open / closed eyes, smiling / not smiling) and facial details (glasses / no glasses). All the images were taken against a dark homogeneous background with the subjects in an upright, frontal position (with tolerance for some side movement).

**\*\*Data Set Characteristics:\*\***

===== Classes	===== 40
Samples total	400
Dimensionality	4096
Features	real, between 0 and 1
=====	=====

The image is quantized to 256 grey levels and stored as unsigned 8-bit integers; the loader will convert these to floating point values on the interval [0, 1], which are easier to work with for many algorithms.

The "target" for this database is an integer from 0 to 39 indicating the identity of the person pictured; however, with only 10 examples per class, this relatively small dataset is more interesting from an unsupervised or semi-supervised perspective.

The original dataset consisted of 92 x 112, while the version available here consists of 64x64 images.

When using these images, please give credit to AT&T Laboratories Cambridge.

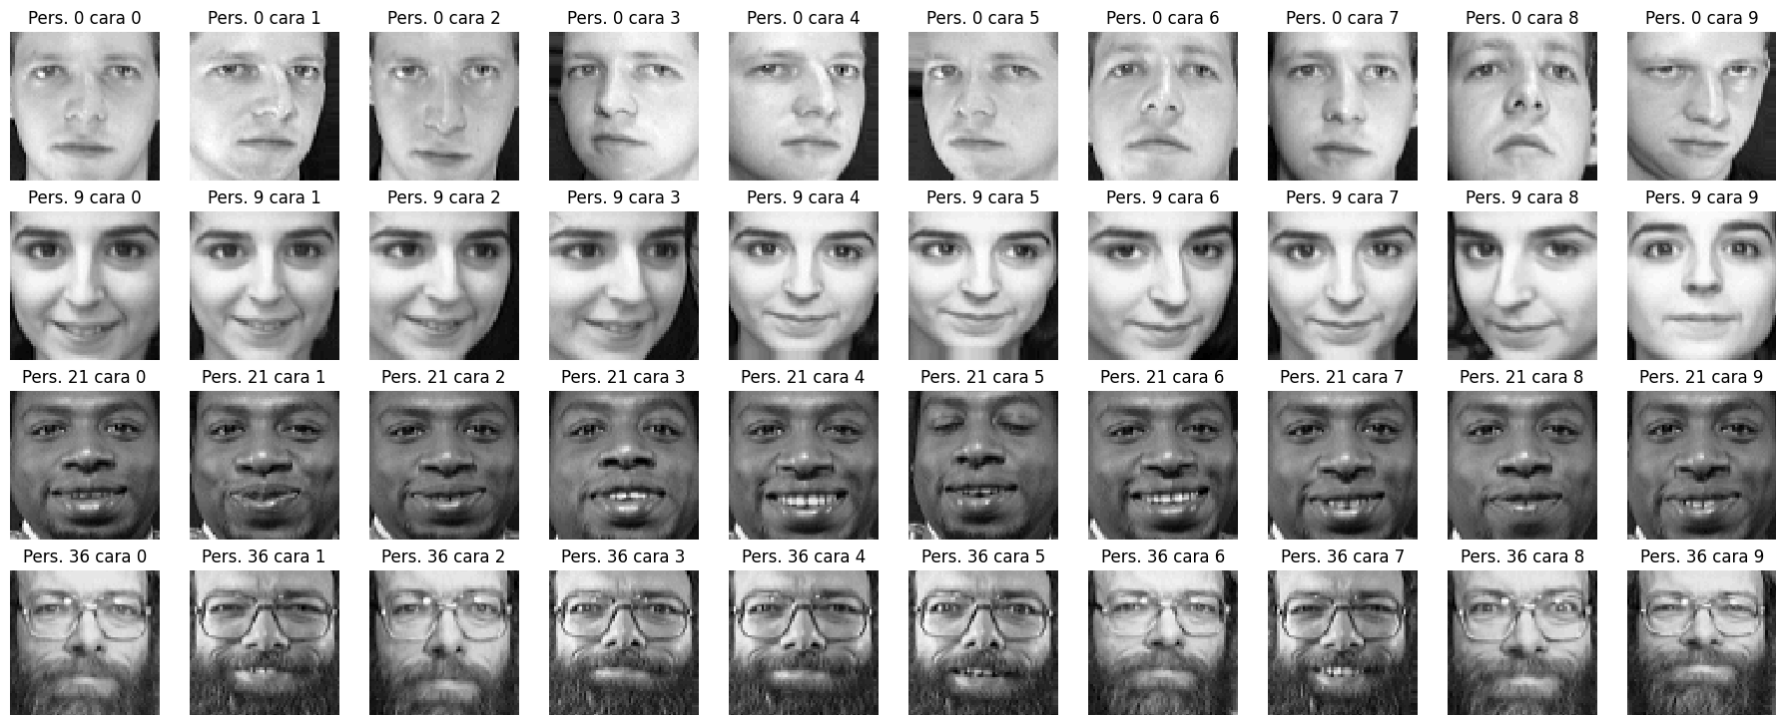

Vejam la primera imatge de cada persona:

```
In [3]: nrows, ncols = 4, 10
fig, axes = plt.subplots(nrows=nrows, ncols=ncols, figsize=(18, 18*nrows/ncols), constrained_layout=True)
for c in np.arange(0, 40):
    ax = axes.flat[c]; ax.set_axis_off(); ax.set_title(f"Persona {c}")
    ax.imshow(orl.images[10*c], cmap=plt.cm.gray, interpolation="none")
```

Vejam les 10 imatges d'algunes persones:

```
In [4]: cc = [0, 9, 21, 36]
nrows, ncols = len(cc), 10
fig, axes = plt.subplots(nrows=nrows, ncols=ncols, figsize=(18, 18*nrows/ncols), constrained_layout=True)
for i, c in enumerate(cc):
    for j in np.arange(0, 10):
        ax = axes.flat[10*i+j]; ax.set_axis_off(); ax.set_title(f"Pers. {c} cara {j}")
        ax.imshow(orl.images[10*c+j], cmap=plt.cm.gray, interpolation="none")
```

# openml

[openml.org](https://openml.org) és una plataforma oberta per a compartir conjunts de dades, algorismes i experiments d'aprenentatge automàtic amb dades tabulades. Els principals conceptes sobre els quals es basa són:

- **Dataset:** conjunt de dades tabulades
- **Task:** conjunt de dades, tasca d'aprenentatge a realitzar i mètode d'avaluació
- **Flow:** pipeline d'aprenentatge automàtic amb detalls sobre programari a emprar i hiperparàmetres a ajustar
- **Run:** experiment d'avaluació d'un flow en una tasca

La tria de conjunts de dades es pot fer en la secció [datasets](#). Els conjunts triats es poden descarregar directament o fent ús de la funció [fetch\\_openml](#) de sklearn. Ara bé, en general és preferible escollir conjunts de dades prèviament triats per altres usuaris (amb algun criteri específic) i publicats en la secció [benchmarks](#). En particular, podem destacar tres "benchmark suites" recents per a comparar i avaluar tècniques de classificació:

- **OpenML-CC18 Curated Classification benchmark:** 72 conjunts de [Bahri et al, 2022](#)
- **Tabular benchmark categorical classification:** 7 conjunts de [Grinsztajn et al, 2022](#)
- **AutoML Benchmark All Classification:** 71 conjunts de [Gijsbers et al, 2019](#)

```
In [ ]: !pip install openml
```

```
In [1]: import openml
# OpenML-CC18 99; Tabular 334; AutoML 271
benchmark_suite = openml.study.get_suite(suite_id=334)
benchmark_suite
